

HOSPITAL ADMIN

We have to develop a web app called Priori. Our website is a **pre-arrival hospital triage and intake system** that helps patients get prioritized *before* they reach the hospital. Instead of waiting in long, unorganized queues, users enter their symptoms (manually or via voice), and the system analyzes them using a rule-based triage engine to assign a priority level. Based on this, patients are placed into a **real-time, dynamically updated queue**, and given an estimated waiting time rather than a fixed appointment. The platform also suggests nearby hospitals based on distance and current load, while allowing users to choose. On the hospital side, staff get a **live dashboard of incoming patients**, sorted by urgency, along with explainable insights to support faster and better decision-making. Overall, the system reduces delays, improves patient prioritization, and helps hospitals prepare in advance for incoming cases.

Common features in all pages:

- All the page will have dark/light theme options
- Top profile logo thing with logout option

Page 1: Login/Sign up

At the top it has "Welcome to PRIORI"

This has 2 user end one by patient and another hospital admin

Login page with a sign-up option, depending on user's choice it will take you to the patient dashboard or the admin dashboard. When a new patient sign's up they are required to give name, phone number, mail id, set a password and it is optional for them to set up Medical history(optional during sign up, quick/basic info) while signing up.

Admin name admin phone no n email id with hospital id are absolutely necessary while signing up

After login all admin pages should have the following panel on left side:

Hospital Admin Panel

Overview

The Hospital Admin Panel enables hospital staff to manage incoming patients in real time, prioritize cases, communicate with patients, and handle emergency requests efficiently.

All components are **connected and updated in real time**.

1. Dashboard

Overview

The Dashboard is the central control panel providing quick access and high-level insights.

Navigation Placards (Clickable)

The dashboard contains placards that redirect to:

- Live Queue
- Patient Details
- Alerts
- SOS Requests

👉 Each placard is clickable and acts as a shortcut to the respective page.

Real-Time Resource Status

Displays current hospital resources:

- Available beds
- ICU beds
- Available doctors
- Ambulances

👉 Helps staff assess capacity instantly

Predictive Load Forecasting

- Predicts upcoming patient load based on incoming cases
- Identifies **rush hours**
- Helps in:
 - staff preparation
 - resource planning

👉 This also connects to:

- Patient ETA (Live Status)
- Queue behavior

Analytics & Reports

Displays:

- Average wait time
- Critical case handling time
- Patient inflow trends

👉 Provides insights for better decision-making

2. Live Queue

Overview

Displays all incoming patients in real time, sorted by priority.

Features

- Priority-based sorting (not arrival time)
 - Color coding:
 -  High
 -  Medium
 -  Low
-

Displayed Information

- Patient name
 - ETA
 - Status
 - Symptom summary
-

Explainable Insights

Each patient shows **why they are prioritized**, for example:

- “Chest pain + breathing difficulty”
- “High fever + age risk”

👉 Not just priority, but reasoning

Purpose

- Faster decision-making
 - Better visibility
 - Reduced mis-prioritization
-

3. Patient Details

Overview

Detailed view and management of a selected patient.

Features

Patient Status Actions

- Mark as **Arrived at Hospital**
- Mark as **Seen by Doctor**

👉 Once marked as completed → removed from queue

View Details

- Symptoms
 - Targeted responses
 - Additional notes
 - Medical history
 - Contact details
-

Edit / Update Symptoms

- Admin can:
 - Add new symptoms
 - Modify existing details

👉 Reflects real-time updates

Flag Patient

- Option to flag unreliable patients

Example:

- “Frequent exaggeration of symptoms”

👉 Used as a caution indicator for future cases

4. Alerts

Overview

Used by admin to send real-time updates to patients.

Types of Alerts

Quick Send Options (Placards/Buttons)

- Preparing for your arrival
 - You are next
 - Delay due to emergency
-

Custom Alerts

- Example:
 - “Doctor will be available in [X] minutes”

👉 Admin enters time → system generates message

Behavior

- Alerts are sent instantly
 - Appear in:
 - Patient Alerts page
 - Patient dashboard placard
-

Integration

- Alerts can be triggered directly from:
 - Live Queue
 - Patient Details
-

5. SOS Requests

Overview

Dedicated section for emergency cases.

Displays

- Incoming SOS alerts
 - Patient details
 - Live location
 - Emergency requirements:
 - Oxygen
 - Equipment
-

Behavior

- Automatically marked **high priority**
 - Highlighted for immediate attention
-

SMS Integration

- Admin receives:
 - SOS notification via app
 - SMS alert on registered phone

Includes:

- Patient location
 - Emergency message
-

Action

- Admin initiates ambulance / emergency response
-

6. Hospital Profile

Overview

Manage hospital and admin details.

Includes

- Hospital name
 - Contact number
 - Admin details
-

Features

- Multiple admins per hospital
 - Update admin information
 - Maintain hospital identity
-

System-Wide Behavior

- All modules are **connected in real time**
- Updates in:
 - Live Queue
 - Patient Details
 - Alerts
 - SOS

👉 reflect instantly across system

Key Principle

👉 “Admins should be able to make fast, informed decisions with minimal effort.”
